Lp(a) Cholesterol	H	11	mg/dL	<3	MCR
Increased Lipoprotein (a) cholesterol. Increased Lp(a) cholesterol has been associated with increased risk for the development of atherothrombotic disease. Evidence suggests that aggressive LDL reduction is beneficial in patients with increased Lp(a). Niacin may lower Lp(a)by up to 25-30%, and niacin has been established as beneficial for CHD prevention, though not specifically because of Lp(a) lowering. Niacin tolerability as well as potential adverse effects on glucose and insulin sensitivity should be considered when selecting candidates for niacin therapy.
