MPSVI, Full Gene Analysis
RECEIVED: 10/30/2013 14:57 **REPORTED:** 10/30/2013 16:13

Reason for Referral MCR

Possible diagnosis of mucopolysaccharidosis type VI (Maroteaux-Lamy syndrome). Test for the presence of mutations in the ARSB gene.

Result MCR

A mutation was NOT detected.

Interpretation MCR

This result decreases the likelihood but does not completely exclude a diagnosis of mucopolysaccharidosis type VI (MPS-VI), also known as Maroteaux-Lamy syndrome.

We predict that there may be disease causing mutations in the ARSB gene not identifiable by the method described (e.g., large deletions/duplications, promoter mutations, or deep intronic mutations).

This assay does not rule out the presence of disease causing mutations in other genes associated with metabolic disease. This result should be interpreted in the context of clinical findings, family history, and other laboratory testing (e.g. arylsulfatase B analysis).

A genetic consultation may be of benefit.

Unless reported or predicted to cause disease, alterations found deep in the intron or alterations that do not result in an amino acid substitution are not reported. These and common polymorphisms identified for this patient are available upon request.

CAUTIONS:
Test results should be interpreted in the context of clinical findings, family history, and other laboratory data. Errors in our interpretation of results may occur if information given is inaccurate or incomplete.

Rare polymorphisms exist that could lead to false-negative or false-positive results. If results obtained do not match the clinical findings, additional testing should be considered.

A previous bone marrow transplant from an allogenic donor

will interfere with testing. Call Mayo Medical Laboratories for instructions for testing patients who have received a bone marrow transplant.					
Laboratory developed test.					
Method					MCR
Bi-directional sequence analysis was performed to test for the presence of mutations in all coding regions and intron/exon boundaries of the ARSB gene. Mutation nomenclature is based on GenBank accession number NM_000046.3.
