Interpretation					SDL
Screen negative for Down syndrome. The risk for trisomy 18 is less than 1%. For neural tube risk assessment, collect specimen between 15,0 and 22,6 (weeks,days) and order AFP Single Marker Screen (81169/MAFP).					
Additional Comments		Initial testing			SDL
Recommended Follow Up		None.			SDL

This screening provides an estimation of risk, not a diagnosis. Incorrect information may significantly alter results.

Risks are adjusted for IVF, donor eggs and frozen embryos.

In twin pregnancies with a fetal demise, results may be unreliable. Results are not available for pregnancies with triplets and higher-order multiples.

Results are positive when the risk for Down syndrome equals or exceeds 1 in 230, or when the risk for trisomy 18 equals or exceeds 1 in 100.

Family history affects risk. If there is a family history of a neural tube defect, chromosome abnormality, or other inherited condition, consider the option of a genetic consultation.
