Test	Flag	Results	Unit	Reference Value	Perform Site*
Dengue Fever Antibodies (IgG, IgM)			REPORTED 01/11/2012 12:02		
Dengue Fever IgG	H	1.10			Y038
Dengue Fever IgM	H	2.00			Y038
Interpretation					Y038

RECENT/CURRENT INFECTION
REFERENCE RANGE: IgG <0.90
IgM <0.90

These assays detect both IgG and IgM class antibodies against all four Dengue fever virus types. Except for very early IgM responses, the immune response to Dengue fever is not type specific. Therefore, type specific reactions are not reported. As with most serological assays, paired testing of acute and convalescent samples is preferred. This is especially important when the acute phase sample is taken within the first six days following onset. In most patients, Dengue antibodies are detectable after the sixth day following the onset of symptoms. Crossreactivity with other flaviviruses is known to occur. The extent and degree of crossreaction varies.

This test was developed and its performance characteristics have been determined by Focus Diagnostics. Performance characteristics refer to the analytical performance of the test.
