MSH2 Known Mutation
RECEIVED: 06/07/2013 14:25 **REPORTED:** 06/13/2013 08:20

Reason For Referral — MCR

Family history of Lynch syndrome. Test for the presence a mutation in the MSH2 gene.

Result — MCR

The c.942+3A>T mutation was NOT detected.

Interpretation — MCR

Absence of the mutation previously identified for an affected family member indicates that this individual is NOT at increased risk for developing Lynch syndrome.

This assay does not rule out the presence of other mutations in this gene or in other genes that are associated with colon cancer and other cancers.

A genetic consultation may be of benefit.

Unless reported or predicted to cause disease, alterations found deep in the intron or alterations that do not result in an amino acid substitution are not reported. These and common polymorphisms identified for this patient are available upon request.

CAUTIONS:
Test results should be interpreted in context of clinical findings, family history, and other laboratory data. Misinterpretation of results may occur if the information provided is inaccurate or incomplete.

Rare polymorphisms exist that could lead to false negative or positive results. If results obtained do not match the clinical findings, additional testing should be considered.

Bone marrow transplants from allogenic donors will interfere with testing. Call Mayo Medical Laboratories for instructions for testing patients who have received a bone marrow transplant.

Laboratory developed test.

Method — MCR

DNA sequence analysis was used to test for the presence of the c.942+3A>T mutation in intron 5 of the MSH2 gene. Testing was performed for this specific mutation because it
