West Nile Virus (WNV) IgM antibodies, in blood or cerebrospinal fluid, are positive in most infected people within 8 days of onset of symptoms and may remain detectable for months. In our laboratory, sera with reactive IgM are rerun in a modified test to rule out nonspecific reactions. IgG antibodies indicate either current or past exposure to the virus.

>1.10 Positive

Antibodies to WNV may cross-react with other viruses (e.g. Dengue, St. Louis Encephalitis, Eastern Equine Encephalitis, Yellow Fever, Enterovirus, CMV).
