Rapid DNA Extraction, Saliva				REPORTED 06/04/2012 10:46	
Comment		See Below			MCR
Result: Genomic DNA was extracted.					

IL28B Polymorphism Genotype, Saliva				REPORTED 06/04/2012 08:56	
IL28B Polymorphism Genotype		CT			MCR
IL28B Interpretation					MCR
<p>IL28B-related rs12979860 CT genotype has been associated with a poorer viral response in HCV genotype 1-infected individuals treated with combined pegylated-interferon and ribavirin therapy as compared to CC genotypes. Individuals with the CC genotype, which is not the situation for this patient, have approximately a 2- to 3-fold greater rate of sustained virologic response (SVR) in HCV genotype 1-infected individuals treated with combined pegylated interferon and ribavirin therapy as compared to either the CT or TT genotypes. Similar SVR have been observed across various racial groups including European Americans, African Americans, and Hispanics. CC genotype has also been associated with a 3-fold increase in rate of spontaneous clearance of HCV. IL28B genotype is only one of many factors that can influence response related to pegylated interferon/ribavirin combination therapy in HCV genotype 1 infection and should be interpreted in the context of other clinical factors.</p> <p>Direct polymorphism analysis of the IL28B-related rs12979860 polymorphism is performed by a Polymerase Chain Reaction (PCR) based 5'-nuclease assay using fluorescently labeled detection probes. This DNA testing will not detect all the known mutations and polymorphisms of IL28B. Absence of mention of a specific gene mutation or polymorphism does not rule out the possibility that a patient has that or another variation that can impact the function of this receptor, drug response or drug side effects.</p> <p>Laboratory developed test.</p>
