2.8

Interpretative Criteria for Probability of Malignancy

Low High

Premenopausal: <5.0 >=5.0 Postmenopausal: <4.4 >=4.4

The OVAl Test is based on a proprietary FDA-cleared software device that combines into a single numberical result the results of Beta-2 microglobulin, Transferrin, Transthyretin, Apolipoprotein Al and CA 125 II (Roche Elecsys[R]). These tests should be ordered independently if clinically indicated. The OVAl Test is an aid to further assess the likelihood that malignancy is present when the physician's independent clinical and radiological evaluation does not indicate malignancy.

* Performing Site:

Y095 Quest Diagnostics Nichols Institute
