Reference Perform Value Site*

ng/mL

Thyroglobulin, FNA, Lymph Node

Thyroglobulin values >1.0 ng/mL suggests the node contains differentiated follicular cell derived thyroid carcinoma. This result assumes thyroid tissue and/or patient blood was not inadvertently aspirated. This test should be interpreted in the context of the clinical presentation, imaging and cytology findings. The testing method is an immunoenzymatic assay manufactured by Beckman Coulter Inc. and performed on the Unicel DXI 800.

Η

Values obtained with different assay methods or kits may be different and cannot be used interchangeably. Test results cannot be interpreted as absolute evidence for the presence or absence of malignant disease.
