AXIN2 Gene, Full Gene Analysis
RECEIVED: 06/05/2013 10:24 **REPORTED:** 06/10/2013 13:02

Reason For Referral

MCR

Possible diagnosis of oligodontia-colorectal cancer syndrome. Test for the presence of a mutation in the AXIN2 gene.

Result

MCR

The following sequence change was detected:

Exon: 8

DNA change: c.1966C>T

Amino acid change: p.R656X (Arg656X)

Classification: DELETERIOUS

Interpretation

MCR

This alteration is a known deleterious mutation.

This result is consistent with a diagnosis of oligodontia-colorectal cancer syndrome for this individual. Appropriate screening procedures and/or prophylactic measures should be considered.

Since a mutation has been identified, testing of at risk family members is possible. Mutation-specific testing for oligodontia-colorectal cancer syndrome is available at Mayo Medical Laboratories by ordering AXINK/61484 AXIN2 Gene, Known Mutation. Please contact the Molecular Genetics Laboratory at 1-800-533-1710 with questions about this test.

A genetic consultation may be of benefit.

Unless reported or predicted to cause disease, alterations found deep in the intron or alterations that do not result in an amino acid substitution are not reported. These and common polymorphisms identified for this patient are available upon request.

CAUTIONS:

Test results should be interpreted in context of clinical findings, family history, and other laboratory data. Misinterpretation of results may occur if the information provided is inaccurate or incomplete.

Rare polymorphisms exist that could lead to false negative or positive results. If results obtained do not match the clinical findings, additional testing should be considered.

Bone marrow transplants from allogenic donors will interfere with testing. Call Mayo Medical Laboratories for instructions for testing patients who have received a bone marrow transplant.

Laboratory developed test.

Method

Bi-directional sequence analysis was performed to test for the presence of a mutation in all coding regions and intron/exon boundaries of the AXIN2 gene. Array comparative genomic hybridization (aCGH) was used to test for the presence of large deletions and duplications. Mutation nomenclature is based on GenBank accession number; NM_004655.3.

MCR

Array Billed?

Yes.
