Test	Flag	Results	Unit	Reference Value	Perform Site*
Varicella Zoster Virus Ab, IgM, CSF VZV Antibody IgM CSF	Н	6.19	ISR	<=0.90	Y00 6

Repeated and verified.

INTERPRETIVE INFORMATION: VZV Ab, IgM, CSF

0.90 ISR or less ...... Negative - No significant level of IgM antibody to

varicella- zoster detected.

0.91 - 1.09 ISR ..... Equivocal - Repeat testing in 10-14 days may be helpful.

1.10 ISR or greater ..... Positive - Significant level of IgM antibody to varicellazoster virus detected, which may indicate current or recent infection. However, low levels of antibodies may occasionally persist for more than 12 months post-infection.

While the presence of IgM antibodies suggest current or recent infection, low levels of IgM antibodies may occasionally persist for more than 12 months post-infection.

The detection of antibodies to varicella-zoster in CSF may indicate central nervous system infection. However, consideration must be given to possible contamination by blood or transfer of serum antibodies across the blood-brain barrier.

Test developed and characteristics determined by ARUP Laboratories. See Compliance Statement B: aruplab.com/CS
