PTPN11 Gene, Known Mutation, B				REPORTED 02/10/2012 10:24	
PTPN11 Gene, Known Mutation					
PTPN11 Known Mutation Result					
The PTPN11 Exon 3, nucleotide c.236A>G, amino acid p.Gln79Arg (p.G79R) familial mutation was not detected in this individual.					
PTPN11 Known Mut Interpretation					
The PTPN11 p.Gln79Arg (p.G79R) mutation was previously identified in a family member with features of Noonan syndrome. Since this mutation was not detected in this individual, this suggests that this patient is at no greater risk than someone in the general population for having Noonan syndrome.					
Fluorescent DNA sequence analysis was used to test for the presence of a specific sequence change in the PTPN11 gene (GenBank accession number NM_002834.3), which was previously identified in an affected family member of this individual.					

A genetic consultation may be of benefit.

CAUTIONS:

Rare polymorphisms exist that could lead to false negative or positive results. If results obtained do not match the clinical findings, additional testing should be considered.

Test results should be interpreted in the context of clinical findings, family history, and other laboratory data. Misinterpretation of results may occur if the information provided is inaccurate or incomplete.

Bone marrow transplants from allogenic donors will interfere with testing. Call Mayo Medical Laboratories for instructions for testing patients who have received a bone
