VDRL, CSF	Positive 1:2		REPORTED 06/21/2012 09:43 Negative	SDL
SEMI-URGENT RESULT Detection of organism-specific antibodies in the CSF may suggest central nervous system infection. However, these results are unable to distinguish between intrathecal antibodies and serum antibodies introduced into the CSF at the time of lumbar puncture or from a breakdown in the blood-brain barrier. The results should be interpreted with other laboratory and clinical data prior to a diagnosis of central nervous system infection. Positive results by this test are not confirmed with a treponemal-specific assay.
