FGA Gene, Known Mutation		REPORTED 08/08/2012 08:20			
Specimen		Blood			MCR
Specimen ID		1038521			MCR
Order Date		01 Aug 2012 11:46			MCR
Reason For Referral					MCR
Family history of transthyretin (TTR) associated familial amyloidosis. Test for the presence of a mutation in the TTR gene.					
Method					MCR
DNA sequence analysis was used to test for the presence of the c.1718G>T (p.R573L) mutation in exon 5 of the FGA gene. Testing was performed for this specific mutation because it was previously identified in an affected family member of this individual. Mutation nomenclature is based on GenBank accession number; NM_000508.3.					
Result					MCR
The following sequence change was detected: Exon: 5 DNA change: c. 1718G>T Amino acid change: p.R573L (Arg573Leu) Legacy nomenclature: p. R554L (Arg554Leu) Classification: DELETERIOUS					
Interpretation					MCR
This alteration is a known deleterious mutation. This result is consistent with a diagnosis of FGA-related familial visceral amyloidosis. Since a mutation has been identified, testing of at risk family members is possible. A genetic consultation may be of benefit. Unless reported or predicted to cause disease, alterations found deep in the intron or alterations that do not result in an amino acid substitution are not reported. These and common polymorphisms identified for this patient are available upon request. CAUTIONS: Rare polymorphisms exist that could lead to false negative or positive results. If results obtained do not match the clinical findings, additional testing should be considered.

Test results should be interpreted in context of clinical findings, family history, and other laboratory data. Misinterpretation of results may occur if the information provided is inaccurate or incomplete.					
Bone marrow transplants from allogenic donors will interfere with testing. Call Mayo Medical Laboratories for instructions for testing patients who have received a bone marrow transplant.
