Hered Pancreatitis, Known Mut			REPORTED 07/13/2012 10:27		
Specimen		Blood			MCR
Specimen ID		1038232			MCR
Order Date		29 May 2012 08:46			MCR
Reason For Referral		Family history of hereditary pancreatitis. Testing of at-risk family member.			MCR
Method		DNA sequence analysis was used to test for the presence of p.R122H (c.365G>A) mutation in exon 3 of the cationic trypsinogen (PRSS1) gene. Mutation nomenclature is based on GenBank accession number; NM_002769. Testing was performed for this specific alteration because it was previously identified in an affected family member of this individual.			MCR
Result		The p.R122H mutation was NOT identified.			MCR
Interpretation		Absence of the mutation previously identified in an affected family member indicates that this individual is NOT a carrier and at no greater risk than someone in the general population for developing symptoms of hereditary pancreatitis.			MCR
		Unless reported or predicted to cause disease, alterations found deep in the intron or alterations that do not result in an amino acid substitution are not reported. These and common polymorphisms identified for this patient are available upon request.			
		CAUTIONS: Test results should be interpreted in context of clinical findings, family history, and other laboratory data. Misinterpretation of results may occur if the information provided is inaccurate or incomplete.			
		Rare polymorphisms exist that could lead to false negative or positive results. If results obtained do not match the clinical findings, additional testing should be considered.			
		Bone marrow transplants from allogenic donors will interfere with testing. Call Mayo Medical Laboratories for instructions for testing patients who have received a bone marrow transplant.
