CA 19-9, Peritoneal Fluid

CA 19-9, Peritoneal Fluid

SDL

33 U/mL

A peritoneal fluid CA19-9 concentration >32 U/mL is suspicious but not diagnostic of a malignant source of the ascites. This cutoff yielded 49% sensitivity, 93% specificity in a study of 137 patients presenting with ascites. CA19-9 levels in peritoneal fluid are most informative when interpreted in conjunction with the CA19-9 serum levels. Tumor marker tests are not specific for malignancy. This test result should be interpreted in the context of clinical presentation, imaging and cytology findings.

ADDITIONAL INFORMATION

The testing method is an immunoenzymatic assay manufactured by Beckman Coulter Inc. and performed

on the UniCel Dxl 800.

Values obtained with different assay methods or kits may be different and cannot be used interchangeably.

Test results cannot be interpreted as absolute evidence for the presence or absence of malignant disease.
