Lyme Disease Ab, Immunoblot, S

IgG Immunoblot

Negative

SDL

Reference Value
Negative

IgG Band(s)

No bands detected kDa

SDL

IgM Immunoblot

Negative

SDL

Reference Value
Negative

IgM Band(s)

No bands detected kDa

SDL

Interpretation

SDL

Specific serologic response to *B. burgdorferi* infection is not detected, but cannot rule out early infection during which low or undetectable antibody levels to *B. burgdorferi* may be present. If clinically indicated, a new serum specimen should be submitted in 7–14 days.

ADDITIONAL INFORMATION

CDC criteria require ≥ 5 bands for IgG or ≥ 2 bands for IgM for the Immunoblot to be considered positive. Bands (e.g., p41) may be detected in patients without Lyme disease, and patterns not meeting the CDC criteria should be interpreted with caution.

Immunoblot should be ordered only on specimens that are positive or equivocal by a FDA-licensed Lyme disease antibody screening test (e.g., EIA).
