Interpretation					
In this sample the activity of both Palmitoyl-Protein Thioesterase 1 and Tripeptidyl Peptidase 1 enzymes are normal. These results indicate that this individual does not have a defect in either the CLN1 or CLN2 gene. However, this does not rule out other forms of neuronal ceroid lipofuscinosis. If clinically indicated, additional testing by Electron Microscopy (MML # 4993) is recommended.
