MYH Gene Analysis
RECEIVED: 06/07/2013 14:47 **REPORTED:** 06/13/2013 08:32

Specimen Blood MCR

Specimen ID 1062116 MCR

Order Date 10 Jun 2013 09:11 MCR

Reason For Referral MCR

Patient has a possible diagnosis of MYH associated polyposis. Test for the presence of mutations in the MYH gene.

Method MCR

A PCR-based analysis (restriction enzyme digest) was used to test DNA for the presence of the Y165C and G382D mutations in the MYH gene.

Result MCR

One copy each of the Y165C and G382D mutations was identified.

Interpretation MCR

This result is consistent with a diagnosis of MYH associated polyposis (MAP). Appropriate screening measures should be considered.

Since two disease causing mutations have been identified for this individual, presymptomatic and/or carrier testing for at-risk family members is possible. Given the MYH mutation carrier frequency of 1/50 in individuals of mixed European ancestry, consider testing the reproductive partner of this individual if appropriate.

A genetic consultation may be of benefit.

CAUTIONS:

Test results should be interpreted in context of clinical findings, family history, and other laboratory data. Misinterpretation of results may occur if the information provided is inaccurate or incomplete.

Rare polymorphisms exist that could lead to false negative or positive results. If results obtained do not match the clinical findings, additional testing should be considered.

Bone marrow transplants from allogenic donors will interfere with testing. Call Mayo Medical Laboratories for instructions for testing patients who have received a bone marrow transplant.
