## DRD4 Genotype, Saliva

### 48 BP Repeat Genotype

4/7

MCR

### ADDITIONAL INFORMATION

Analysis of DRD4 variable number tandem repeats (VNTRs) are performed by sizing of product amplicon following PCR amplification. Not all known mutations and polymorphisms of DRD4 will be detected using this assay. Absence of a detectable gene mutation or polymorphism does not rule out the possibility that a patient has another variation that can impact the function of this receptor, drug response, or drug side effects.

### Reviewed by

Jamie Brufat

MCR

### CAUTIONS:

If the patient has had an allogeneic blood or marrow transplant or a recent (i.e. less than 6 weeks from time of sample collection) heterologous blood transfusion these results may be inaccurate due to the presence of donor DNA. Laboratory developed test.

### Interpretation

This genotype has been associated with a poorer response to methylphenidate in individuals treated for attention deficit/hyperactivity disorder (ADHD). This individual may require higher than average doses of methylphenidate when treating ADHD.
