Cysticercus Antibody, ELISA (CSF)				REPORTED 10/12/2009 09:19	
Cysticercosis Ab, ELISA, CSF		4.80			
REFERENCE RANGE: <0.75					

INTERPRETIVE CRITERIA:

<0.75 Antibody Not Detected
 > or = 0.75 Antibody Detected

Cysticercosis is caused by infection with the larval form (cysticercus) of the pork tapeworm, Taenia solium. Clinical manifestations of cysticercosis most commonly result from the lodging of cysticerci in brain and neural tissue. Common symptoms of neurocysticercosis include seizures and convulsions. Antibodies to other parasitic infections, particularly echinococcosis, may crossreact in the cysticercus IgG ELISA. Confirmation of positive ELISA results by the cysticercus IgG antibody Western blot is thus recommended.

Diagnosis of central nervous system infections can be accomplished by demonstrating the presence of intrathecally- produced specific antibody. Interpretation of results may be complicated by low antibody levels found in CSF, passive transfer of antibody from blood, and contamination via bloody taps.

Test Performed by: Focus Diagnostics, Inc.
 5785 Corporate Avenue
 Cypress, CA 90630-4750

Medical Director, Alfred Lui, MD
