Lupus Anticoagulant Profile Testing Algorithm

LUPPR / Lupus Anticoagulant Profile
Testing begins with:
- Prothrombin Time (PT), Plasma
- Activated Partial Thromboplastin Time (APTT), Plasma
- Dilute Russell’s Viper Venom Time (DRVVT), Plasma

*Weak lupus anticoagulant may not inhibit DRVVT Mix
** Additional assays may be performed if further clarification or confirmation is necessary based on preliminary review. These may include:
  - Coagulation Factor Assays
  - Bethesda Units
  - Fibrinogen
  - Soluble Fibrin Monomer
  - Staclot Lupus Anticoagulant
  - D-Dimer

*** Unfractionated/low-molecular weight heparin or direct thrombin inhibitor (eg, dabigatran, argatroban) warfarin or low concentration of direct anti-Xa inhibitor (eg, rivaroxaban, apixaban, or edoxaban)

An interpretive report is included with this profile. If any tests are abnormal, all results will be reviewed by a coagulation consultant.
