von Willebrand Disease Profile

VWPR / von Willebrand Profile
Testing begins with:
- Coagulation Factor VIII Activity Assay, Plasma
- von Willebrand Factor Antigen, Plasma
- von Willebrand Factor Activity, Plasma

Coagulation Factor VIII Activity
- <55%
- 55%–200%

von Willebrand Factor (VWF) Antigen
- <55%
- 55%–200%

von Willebrand Factor (VWF) Activity
- <55%
- 55%–200%

VWF Activity: VWF Antigen Ratio
- <0.8

Ristocetin Cofactor, Plasma
- Normal

von Willebrand Factor Multimer Analysis, Plasma
- No evidence of von Willebrand disease. No further testing performed.
- An interpretive report will be provided

If clinical and laboratory information suggest specific factor VIII inhibitor, Coagulation Factor VIII Inhibitor Screen, Plasma may be performed.

Elevated factor VIII, von Willebrand factor activity, or von Willebrand factor antigen are of uncertain clinical significance.
