AFP, Peritoneal Fluid

SDL

6.1 ng/mL

A peritoneal fluid AFP concentration > 6.0 ng/mL is suspicious but not diagnostic of ascites related to HCC. This clinical decision limit cutoff yielded 58% sensitivity and 96% specificity in a study of 137 patients presenting with ascites. Tumor marker tests are not specific for malignancy. This test result should be interpreted in the context of clinical presentation, imaging and cytology findings.

ADDITIONAL INFORMATION

The testing method is an immunoenzymatic assay manufactured by Beckman Coulter Inc. and performed on the UniCel Dxl 800.

Values obtained with different assay methods or kits may be different and cannot be used interchangeably.

Test results cannot be interpreted as absolute evidence for the presence or absence of malignant disease.

Alpha-Fetoprotein values are not interpretable in pregnant females for the investigation of malignant disease.
