Interpretation (ALA), U

MCR

In this sample, the excretion of aminolevulinic acid (ALA) was elevated. This finding is indicative of a possible biochemical diagnosis of one of the following conditions: acute intermittent porphyria, hereditary coproporphyrin, or variegate porphyria. Alternatively, this result could be a manifestation of either heavy metal(lead)intoxication or hereditary tyrosinemia type I. Based on clinical history, consider urine porphyrins profile analysis including porphobilinogen, whole blood lead, a heavy metals screen, and urine succinylacetone analyses.

ADDITIONAL INFORMATION

Liquid Chromatography-Tandem Mass Spectrometry (LC-MS/MS)
