<b>Plasma Hemoglobin, P</b>					
<b>RECEIVED:</b> 06/25/2013 14:09 <b>REPORTED:</b> 06/25/2013 15:15					
Total Hemoglobin	H	25.9	mg/dL	0.0-15.2	MCR
Oxyhemoglobin	H	13.9	mg/dL	0.0-12.4	MCR

Both total and oxyhemoglobin values are reported. If there is a discrepancy between the values, the oxyhemoglobin measurement is the least affected by potential interfering substances such as bilirubin or medications. Additionally, false elevations in plasma hemoglobin levels are commonly seen due solely to artifactual in-vitro effects such as: delayed separation of plasma from red blood cells (greater than 2 hours), traumatic draws/incorrect tube draw sequence, or any post draw condition which causes hemolysis in the tube (i.e. increased temperature, excessive vortexing, etc.). Positive results should be interpreted as a component of the complete clinical context.
