CYP2C9 Genotype

CYP2C9 Phenotype Interpretation MCR

Predicted extensive (normal) metabolizer. This patient has a genotype associated with extensive (normal) enzymatic activity. There is a small residual risk of having a rare, undetected polymorphism which may result in intermediate or poor metabolizer status. This should be considered if the predicted phenotype is discordant with clinical findings. Bidirectional DNA sequence analysis was used to test for the presence of variants in exons 3, 5, and 7 of the CYP2C9 gene. These sequencing reactions detect the presence of CYP2C9 430C>T (*2), 818delA (*6), 1075A>C (*3), 1076T>C (*4), and 1080C>G (*5). This sequencing assay will not detect all the known mutations that result in decreased or inactive CYP2C9. Rare polymorphisms could interfere with test results. Absence of a detectable gene mutation or polymorphism does not rule out the possibility that a patient has an intermediate or poor metabolizer phenotype. Patients with an extensive or intermediate metabolizer genotype may have CYP2C9 enzyme activity inhibited by a variety of medications or their metabolites. The following is a partial listing of drugs known to affect CYP2C9 activity as of the date of this report.

Drugs that undergo metabolism by CYP2C9:
Angiotensin II Blockers: irbesartan, losartan
Anticoagulants: warfarin
Anti-depressants: amitriptyline (minor), fluoxetine (minor)
Non-Steroidal Anti-Inflammatory Drugs (NSAIDS): celecoxib, diclofenac, ibuprofen, naproxen, piroxicam, suprofen Oral Hypoglycemic Agents: glipizide, glimepiride, glyburide/glibenclamide, nateglinide, tolbutamide
Miscellaneous Drugs: fluvastatin, phenytoin, rosuvastatin (minor), sulfamethoxazole, tamoxifen, torsemide.
Co-administration may decrease the rate of elimination of other drugs metabolized by CYP2C9.

Drugs known to increase CYP2C9 activity: Phenobarbital, rifampin, secobarbital. Co-administration of these drugs increase the concentration of CYP2C9.

Drugs known to decrease CYP2C9 activity: Amiodarone,

fenofibrate, fluconazole, fluvastatin, fluvoxamine, isoniazid, lovastatin, phenylbutazone, sertraline, sulfamethoxazole, sulfaphenazole, teniposide, ticlopidine, voriconazole, zafirlukast. Co-administration will decrease the rate of metabolism of CYP2C9 metabolized drugs, increasing the possibility of toxicity, particularly in heterozygous individuals. Laboratory developed test.					
CYP2C9 Genotype Star Alleles		1/1			MCR

CYP2C9 Genotype Interpretation					MCR
This patient has two copies of alleles encoding CYP2C9 protein with normal activity. Additional descriptions of the effects of the star alleles on CYP2C9 function are found in the Mayo Test Catalog (http://www.mayomedicallaboratories.com/test-catalog/).
