## DRD3 Genotype, Saliva

**Reviewed by**

Jamie Bruflat

MCR

**DRD3 Genotype**

Homozygous DRD3 25G/25G [glycine/glycine]. This individual is homozygous for the DRD3 25G allele which encodes for the glycine/glycine genotype. The glycine allele is associated with better response to clozapine and olanzapine but a poorer response to risperidone than other genotypes. The glycine allele has also been associated with higher risk of development of tardive dyskinesia after use of typical antipsychotics.

**ADDITIONAL INFORMATION**

Direct polymorphism analysis of the DRD3 25A>G [Ser9Gly] polymorphism is performed by allele specific primer extension

MCR

assay following PCR amplification. This DNA testing will not detect all the known mutations and polymorphisms of DRD3. Historically, the SNP is located at position 25 of the cDNA. However, more recent work indicates it is position 456 of the cDNA. Absence of mention of a specific gene mutation or polymorphism does not rule out the possibility that a patient has that or another variation that can impact the function of this receptor, drug response or drug side effects.

**CAUTIONS:**

If the patient has had an allogeneic blood or marrow transplant or a recent (i.e. less than 6 weeks from time of sample collection) heterologous blood transfusion these results may be inaccurate due to the presence of donor DNA. Laboratory developed test.
